2-2 minutes

QUICK RECAP

WEEK OVERVIEW

This week focuses on strengthening AI agents through planning, self-reflection, and structured reasoning to solve complex business problems effectively. The sessions cover multi-step reasoning and task decomposition for breaking real-world workflows into manageable components, and examine how structured reasoning helps agents adapt to evolving business requirements. The week also introduces the ReAct framework and concludes with hands-on practice designing agents that combine reasoning and action for informed business decision-making.

The following topics will be covered:

- The role of planning
- Self-reflection
- The role of reasoning
- Multi-step Reasoning
- Task Decomposition
- Introduction to ReAct Framework

LEARNING OBJECTIVES

By the end of this module, you will be able to:

- Explain the role of planning, self-reflection, and reasoning in enhancing the effectiveness of AI agents for solving complex business problems.
- Apply multi-step reasoning and task decomposition to break down real-world workflows into manageable, automatable components.
- Analyze how structured reasoning enables AI agents to adapt dynamically to evolving tasks and business requirements.
- Demonstrate the application of the ReAct framework to design agents that combine reasoning and action for business decision-making.
