Great Learning

2-2 minutes

In this section, we'll cover the hands-on implementation of a single agent with tools, memory, reasoning, and planning.

The upcoming videos, covering a practical walkthrough of how to build a single-agent system with the aforementioned properties, will be a continuation of the previous week's hands-on videos.

Please ensure that you run the notebook/file from the beginning, where the database setup, library imports, and library installations were completed. Once all the code snippets (till before "Reasoning in Agents") covered in the previous week's videos are executed, only then proceed to execute the code snippets shown in the upcoming videos.

- Running the file from the middle without completing these initial steps will result in errors.

Important Note: Run It Yourself on Colab!

You can execute the notebook using Google Colab to try out the code yourself.

- Please refer to the instructions on pages "**Google Colab Guide (Pre-work)"** for details on how to open it with Google Colab.

> We **highly recommend downloading the files below and following along with the professor** so that you can work simultaneously with the faculty while watching the video content.
