Agentic AI Foundations

Session Plan: Introduction to Generative AI and Large Language Models Case Study

Learning Objectives

- Summarize how Agentic AI can be used to solve a business problem
- Outline the stages of an end-to-end Agentic AI solution and how they connect to form a complete system

Important Points to Note

- This session is a preview of what you'll be capable of building by the end of the program.
- The objective is to experience how businesses use Agentic AI to solve problems and how the complete system comes together end-to-end.
- The focus of this session is on the end-to-end solution: how it works, an overview of the methods involved and their interconnectivity, and the final outputs; NOT the technical details, code, or syntax behind it.
- The technical details of how each piece was built (setups, configurations, code) and the associated concepts are NOT within the scope of the session. These details will be covered progressively over the course of the program, both conceptually and via hands-on implementation.
- You're NOT expected to write/reproduce code at this stage; that comes later in the program as we progress.
