

An agent is a model calling tools in a loop until a given task is complete.

A harness is everything around that loop: the prompt, the tools, and any middleware that shapes the model's behavior.

`create_agent` is a highly configurable harness. At its simplest, you can create one with:

Building on that, you can configure the basics directly with the `model=`, `tools=`, and `system_prompt=` parameters. For more advanced capabilities, extend the harness with `middleware`.

## Core components
