

Generative AI vs. Predictive AI: What's the Difference?

Great Learning Editorial Team : 9-12 minutes : 1/29/2025

Generative AI and Predictive AI are two subfields of Artificial Intelligence. While Generative AI produces new content, Predictive AI deals with future predictions based on past data.

Introduction

[Artificial intelligence \(AI\)](#) revolutionizes our work, lives, and engagement with technology. Two different subfields of AI—[Generative AI](#) and [Predictive AI](#)—have become essential sources of innovation in the broad field. Although they use data and complex algorithms, their functions are essentially different.

Predictive AI obeys the principle of foreseeing the future. At the same time, generative AI is fed with an algorithmic logic framework for generating new data or pieces of content. In this article, we will explore both Generative AI and Predictive AI, along with their functionalities, differences and real-world examples.

[Master Generative AI](#)

Learn about Generative AI and how to apply it for creating art, generating content, and exploring endless possibilities. Perfect for anyone eager to dive into the future of technology.
